

Risk Matrix

Probability	High	User do not understand how to operate NSAK		Not enough time for testing (drills, scenarios and environments)		AI Credits are to expensive to build and test the AI scenario	
		The NSAK framework/ device itself is vulnerable	Regressions: Tested scenarios stop working, because a drill was changed	Simulate or build network environments need more time as planned			
	Medium	An existing framework already does everything we have planned	The AI might go rough in the AI scenario	Complex Network environments need more hardware than available	Scenarios and drills need more time as planned	Not enough time for documentation	Scope is too large for bachelor thesis
			Drills not compatible between scenarios	Misaligned communication lead to wrong expectations	The AI bubble bursts and we need to switch AI provider	Not enough time for media artifacts (Poster, Presentations, Film, Book, etc.)	Scenario or drill to complex for automation
	Low	Lack of resources for attack scenarios	Lack of resources/ consensus for defense scenarios	The NSAK hardware devices stop working		One of the students gets injured or sick	
		NSAK gets abused by hackers					
		Low		Medium		High
